A Future for Nature

National Ecological Networks

6 February 2013

Bill Adams
Department of Geography
University of Cambridge
Conservation and the future

• Conservation is about negotiating the transition from past to future in such a way as to secure the transfer of maximum significance’ (Alan Holland and Kate Rawles 1993 ‘Values in conservation’ Ecos 14(1): 14-19)
Threats and Impacts

• over-harvesting, overfishing, agricultural intensification, urbanisation, toxic chemicals, ocean acidification, climate change…

• 5-20% of c.14 million plant and animal species on earth are threatened with extinction.

• 75% habitable earth disturbed by human activity
Conservation and the Past

• ‘Like the great libraries of the world, which strive to preserve history’s written traditions, we struggle against huge forces of destruction and forgetting
Conservation as separation: Protected Areas

- 2003 UN List: 11.5% global land surface
Planetary Boundaries

1. Climate Change
2. Ocean acidification
3. Stratospheric ozone layer
4. Nitrogen and phosphorus cycle
5. Global hydrological cycle
6. Land use change
7. Biodiversity
8. Atmospheric aerosol loading
9. Chemical pollution

Protected Areas?

- Protected areas are geographically fixed and increasingly isolated by habitat destruction, and are therefore poorly suited to accommodating range shifts due to climate change’

Conservation Landscapes

• ‘Wider countryside’ matrix: ecological networks and mosaics of habitat patches
• New conservation strategies: landscape-scale conservation
Re-connecting Conservation Landscapes

- ‘more, bigger, better and joined’

Protected Areas and Range Expansion

Fig. 1. (A) Locations of PAs (Sites of Special Scientific Interest) within Great Britain. (B) Dartford warbler S. undata distribution change, showing 10 x 10-km grid squares considered to be core (occupied before and since the end of 1991; blue squares) and colonized (occupied since 1991 only; red squares). (C) Silver-spotted skipper H. comma distribution change, showing 10 x 10-km grid squares considered to be core (occupied during 1970–1982 and 1995–2010; blue squares) and colonized (not occupied 1970–1982 but occupied 1995–2010; red squares). (D) Expanded view of the 10 x 10-km grid squares highlighted in B showing the location of PAs in green, the locations of S. undata records in core areas (blue), and the locations of records in colonized areas (red). (E) Expanded view of the 10 x 10-km grid squares highlighted in C showing the location of PAs in green, the locations of H. comma records in core areas (blue), and the locations of records in colonized areas (red). Scale bars are in kilometers.

Technological Nature

• ‘we have begun to change our species’ long-standing experiences with nature. Now we have what I am calling technological nature: technologies that in various ways mediate, augment, or simulate the natural world’

FENS FOR THE FUTURE

A Proposal for an Enhanced Ecological Network for Fenland

This map presents a proposal for the creation and enhancement of an ecological network for Fenland. The plan boundary is based on the Fenland National Character Area and comprises the 'Stalled Fen' and the 'Open Fen' forms of Fenland, where associated habitats are dependent on freshwater systems. The 'Open Coastal Marshes' and 'Drained Coastal Marshes', which are coastal in nature and whose conservation has been led by two long-standing partnerships: the Wash Estuary Strategy Group and the Wash and North Norfolk Coast European Marine Site Partnership, are omitted.

The proposed ecological network is based on the structure recommended in the Natural Environment White Paper: The Natural Choice: securing the value of nature, published in June 2011, which in turn is based on the Lawton Report: Making Space for Nature: A review of England’s Wildlife Sites and Ecological Network. The proposed network comprises the following elements: core areas, corridors, stepping stones, restoration areas, buffer zones and sustainable use areas. Full descriptions of each of these are provided in the accompanying report: A Strategic Plan for Fenland: A Proposal for an Enhanced Ecological Network.

Core Areas

Areas of high nature conservation value which form the heart of the network. They contain habitats that are rare or important because of the wildlife they support or the ecosystem services they provide. They comprise the remaining areas of fen and the wetland habitats of the Great Washes. They are all Sites of Special Scientific Interest (SSSI) and have international recognition as Special Areas of Conservation (SAC) and Special Protection Areas (SPA).

- Proposed Priority Landscape Corridor
- Proposed Landscape Corridors
- Proposed Secondary Corridors

Landscape Corridors and Secondary Corridors improve the functional connectivity between core areas, enabling species to move between them to feed, disperse, migrate or reproduce. As it is largely a wetland system the proposed Landscape Corridors comprise the main rivers and main drains, but Secondary Corridors are also identified to provide useful additional connectivity. It is recommended that priority should be given to the development of the proposed Priority Landscape Corridor which connects the southern Fen and Gunton Washes to the Great Fen and to the Nene Washes.

Stepping Stones (to be identified)

Connectivity need not come from linear, continuous habitats, a number of small sites may act as Stepping Stones across which certain species are able to move between Core Areas. It is envisaged that smaller, currently isolated, SSSI and Local Wildlife Sites will be the foundation for the development of Stepping Stones.

Restoration Areas

Areas where measures are already underway to restore or create new high value habitats and species populations, and where ecological functions are enhanced. They are often located as an extension to existing Core Areas.

Buffer Zones (to be identified)

Areas surrounding Core Areas, Restoration Areas, Stepping Stones and Corridors, that protect them from adverse impacts from the wider environment. Often Restoration Areas have been planned adjacent to Core Areas and part of their function is to buffer them. However, Restoration Areas will also require buffering from adjoining intensive land uses.

Sustainable Use Areas

Areas within the wider landscape where the focus is on the sustainable use of natural resources and appropriate economic activities. Together with the maintenance of ecosystem services. Set up appropriately, they will help to buffer the matrix outside the Proposed Ecological Network and make it more permeable and less hostile to wildlife, including self-sustaining populations of species that are dependent upon, or at least tolerant of, certain forms of agriculture. The indicative Sustainable Use Areas identified here are based on areas with the highest assemblages of key farmland birds: corn bunting, grey partridge, lapwing, turtle dove, tree sparrow and yellow wagtail.

- Target Areas (some habitat restoration underway)
- Target Areas (no current habitat restoration activity)

Areas identified by partners for habitat creation and restoration. Habitat restoration projects are already taking place in some of the Target Areas, but in others restoration work is yet to get underway.

SSSI

Local Wildlife Sites

Fen Waterways Link

Nene Valley Nature Improvement Area

Note: The proposed Enhanced Ecological Network is based on existing ecological important sites and features, in particular SSSI and the main rivers and drains. Local Wildlife Sites will also be important components of an enhanced network by providing the focus for the development of stepping stones. Although many of these sites and features are visible on the map, many more, including some of the most extensive, are obscured by the components of the ecological network e.g., although Gunton Washes is an SSSI, it appears as a Core Area on the map. Similarly, many of the main rivers and drains are hidden under the Corridors.
National Ecological Network, Netherlands, 2004
Economic Landscapes
Landscapes: beyond barriers

‘Perhaps the greatest challenge of all is to change the way we think about protected areas. In the past they have been seen as islands of protection in an ocean of destruction. We need to learn to look on them as the building blocks of biodiversity in an ocean of sustainable human development, with their benefits extending far beyond their physical boundaries’

– Achim Steiner *New Scientist* 18 October 2003, p.21
Seascapes
Restoration

• ‘At best, preservation can only hold on to what already exists. In a world of change we need more than that. Ultimately, we need a way not only of saving what we have but also of putting the pieces back together when something has been altered, damaged, or even destroyed’ (Jordan, 1988)
Restoration: Reweaving the diversity of life

• ‘Let us go beyond mere salvage to begin the restoration of natural environment …. There can be no purpose more enspiriting than to begin the age of restoration, reweaving the wondrous diversity of life that still surrounds us'. p. 335.
Landscape scale projects in the fens

- **Wicken Vision** - 5,300ha of which 764 ha owned including NNR (National Trust)
- **Great Fen** 3,700 ha of which 2090 ha owned including NNRS (Wildlife Trust and NE)
- **Lakenheath RSPB**
‘Open-ended restoration

- Accepts novel starting point and conditions
  - No reference systems
- Accepts uncertainty and novel outcomes
  - No species or habitat targets
- Emphasizes landscape dynamics e.g. flooding
  - Low or no management
- May be a deliberate policy or *de facto* (uncertainty, funding, remoteness)

Open-ended Restoration: Wicken Fen, Cambridge
Restoring Species

- Red Kite 1989 -1994
- Beaver 2009
Saving Nature in a Post-wild World

- *Rambunctious Garden: saving nature in a post-wild world*,
  - Bloomsbury’ Emma Marris 2011
  - nature in and around human lives

- ‘All existing ideas about what constitutes naturalness may need to be overhauled, particularly in the light of climate change’
  - *Authenticity in Nature*, Nigel Dudley 2011
The Welcome Alien?

- How do you define whether a species is native or alien in a rapidly changing global environment?’ (Webber and Scott 2011 *Global Ecology and Biogeography Letters*)
Alien Species

- ‘Conservationists should assess organisms on environmental impact rather than whether they are natives’ Davies et al 2011 Nature 474

- ‘A dynamic view of nature that recognizes that species characteristics and human valuations thereof change over time, not only reflects ongoing evolutionary processes, but also leads to a more balanced and objective approach to the management of non-native species’ (Schlaepfer et al. 2010, Conservation Biology, p.8).
**Assisted Colonisation**

- In situ, ex-sit trans-situ conservation (Chris Thomas)
- ‘assisted colonization might face insurmountable governance issues…..only with concerted investment in *in situ* initiatives of a sufficient scale will endangered species have a future. (Vila and Hulme 2011)

Pokémon Biodiversity

- British children leave primary school able to name 80 per cent of Pokémon characters but only 50 per cent of common types of wildlife
Web Cams

Get the best views of Scottish wildlife...

Can't wait to see Scotland's wildlife?

Whet your appetite with some up-close views of the country's speciality species! Fantastic, up-to-date web cam images can now be viewed on visitscotland.com/wildlife.
Beyond Ecological Connections
Who possesses this landscape?
The man who bought it or
I who am possessed by it?

False questions, for
this landscape is
masterless
and intractable in any terms
that are human.

Norman MacCaig  
*A man in Assynt*
